# CASE STUDY

It consists of 1 dataset  
which further consists

- Patient ID
- Age
- Sex
- Cholesterol
- Blood Pressure
- Heart Rate
- Diabetes
- Family History
- Smoking
- Obesity
- Alcohol Consumption
- Exercise Hrs Per Week
- Diet
- Previous Heart Problems
- Medication Use
- Stress Level
- Sedentary Hrs Per Day
- Income
- BMI
- Triglycerides
- Physical Activity Days Per Week
- Sleep Hrs Per Day
- Country
- Continents
- Hemisphere
- Heart Attack Risk

# FINDINGS

- *Percentage of individuals who are at risk of Heart Attack*
- *Gender wise risk*
- *Continent wise count of Heart Attack Risk*
- *Major Risk Factors for a Heart Attack*
- *How Healthy Habits fails to work if one is prone to anyone of the Major Risk Factors*

# OBJECTIVES

- Analyse the risk of Heart Attack in each individuals
- Publish the findings based on Data Analysis

# DATA ANALYSIS

- For analysing the data, various factors affecting the risk of Heart Attack should be listed out
- In this case study, the table consists of 26 columns.

# PERCENTAGE OF INDIVIDUALS AT RISK OF HEART ATTACK

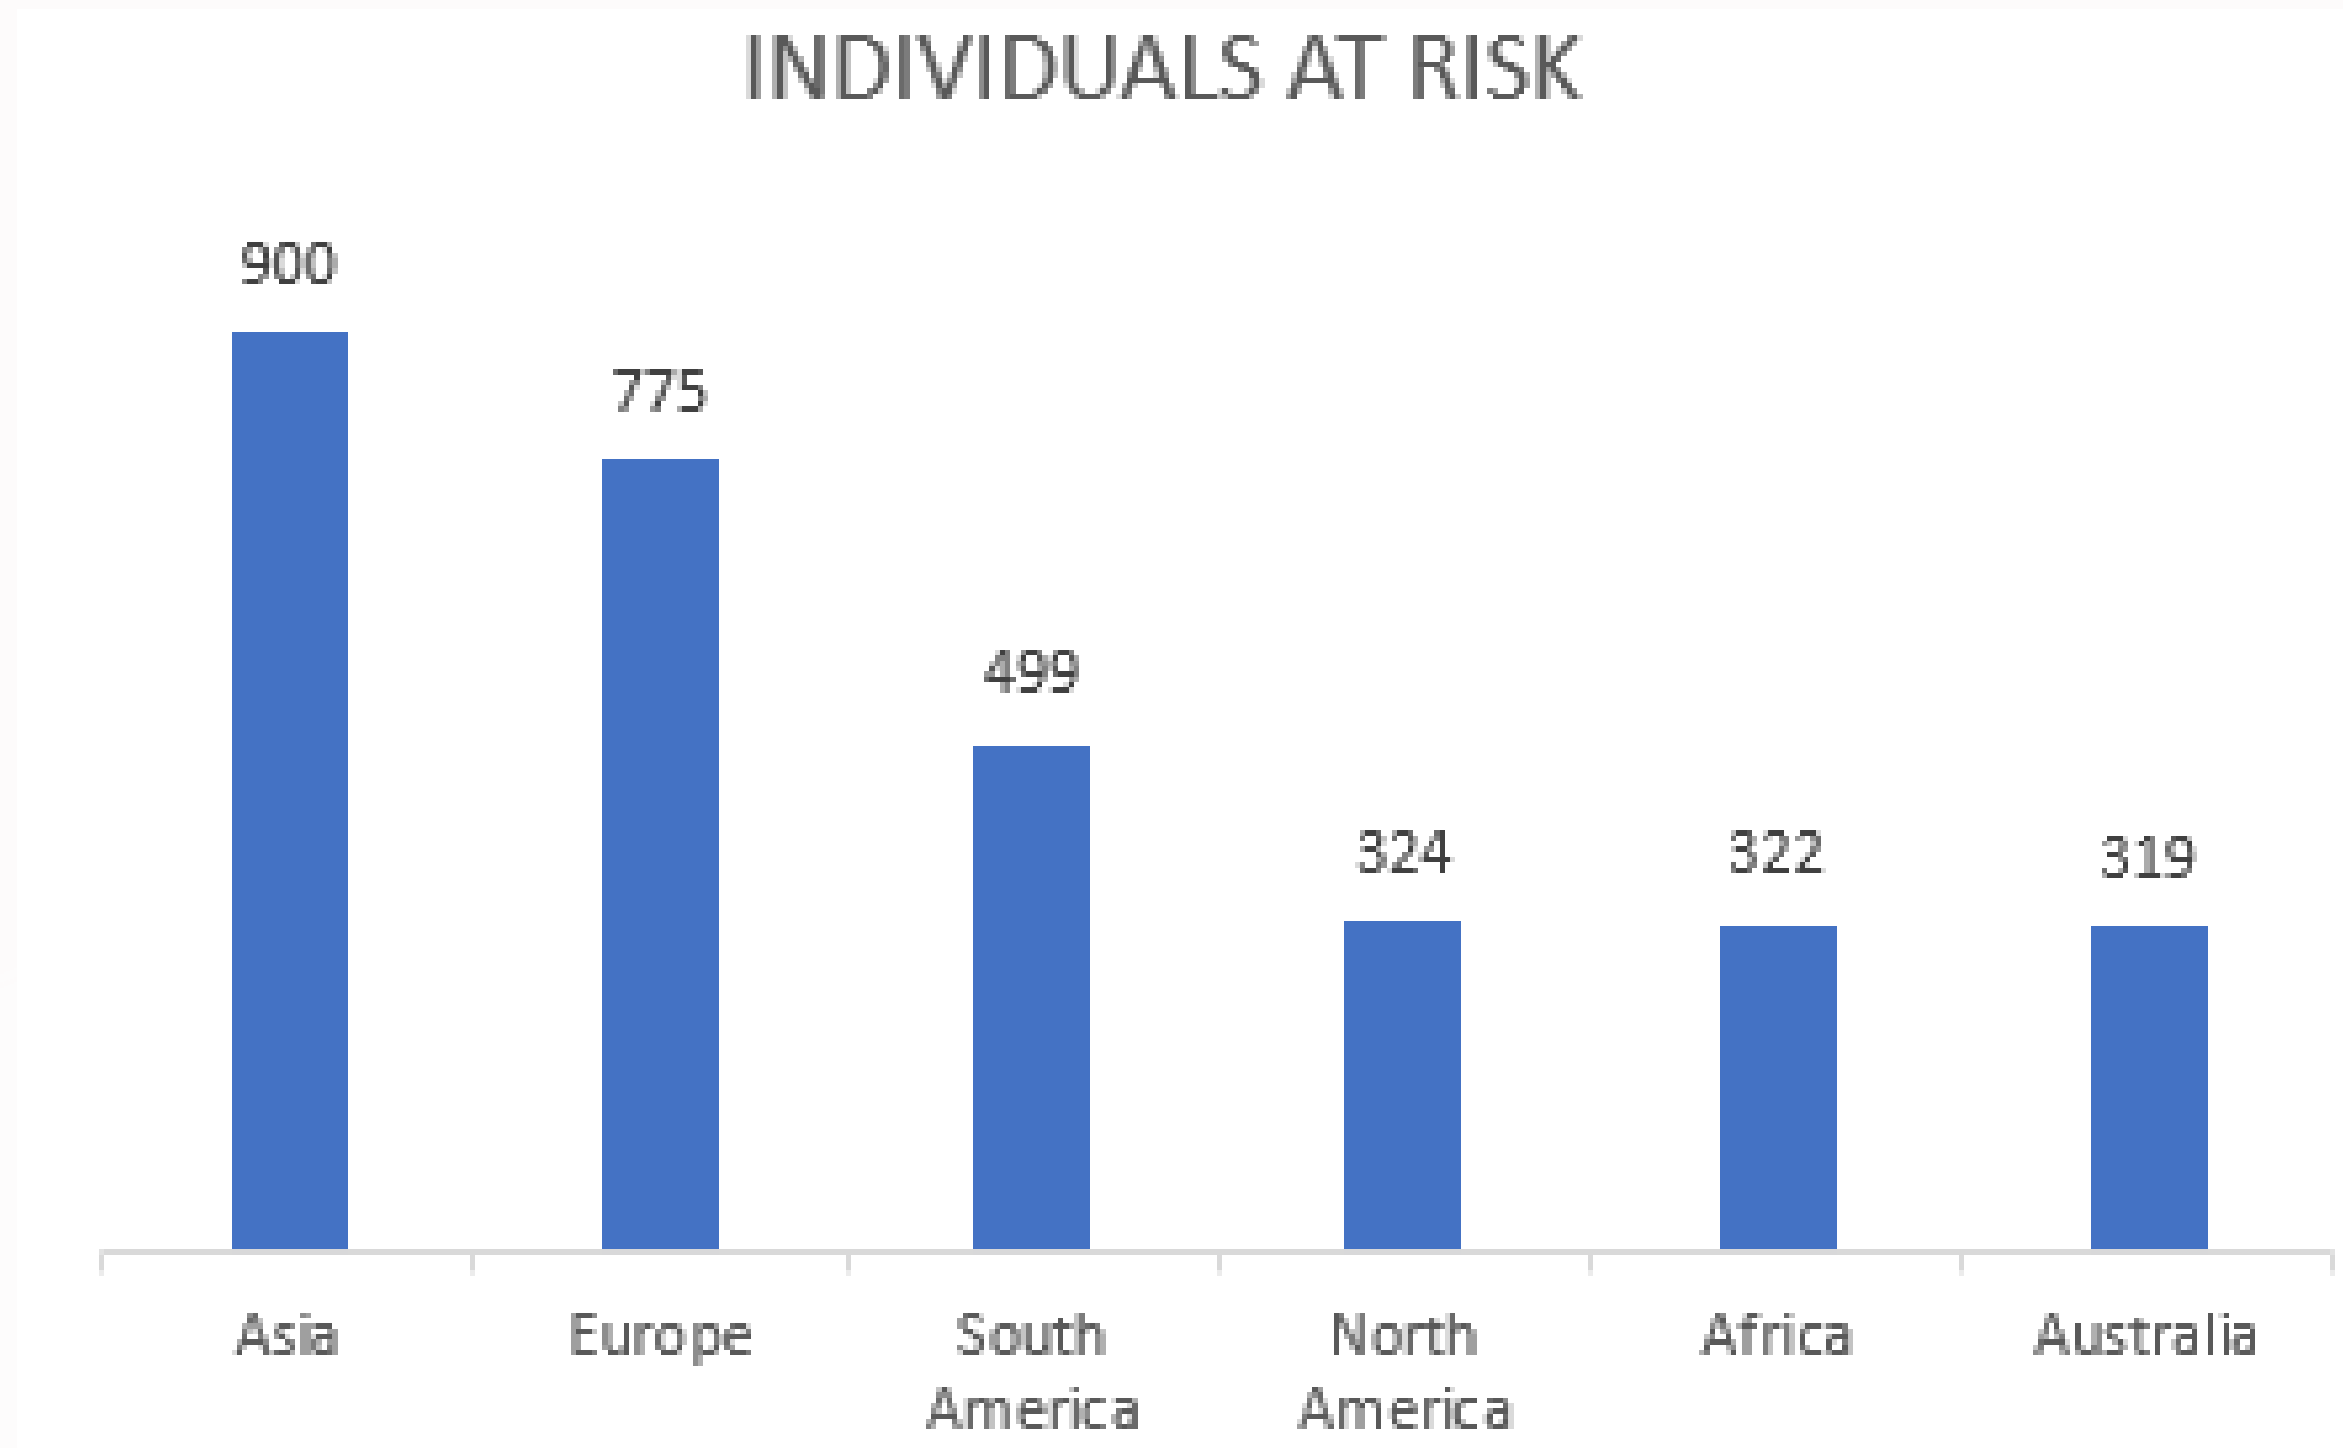

# PERCENTAGE OF MALES AND FEMALES WHO ARE AT RISK OF HEART ATTACK

# CONTINENT WISE COUNT OF HEART ATTACK RISK

# CONTINENT WISE COUNT OF MALES AND FEMALES AT RISK

# DEALING WITH ASIA

Sales

# 3 MAJOR RISK FACTORS

#1

SMOKING

#2

DIABETES

#3

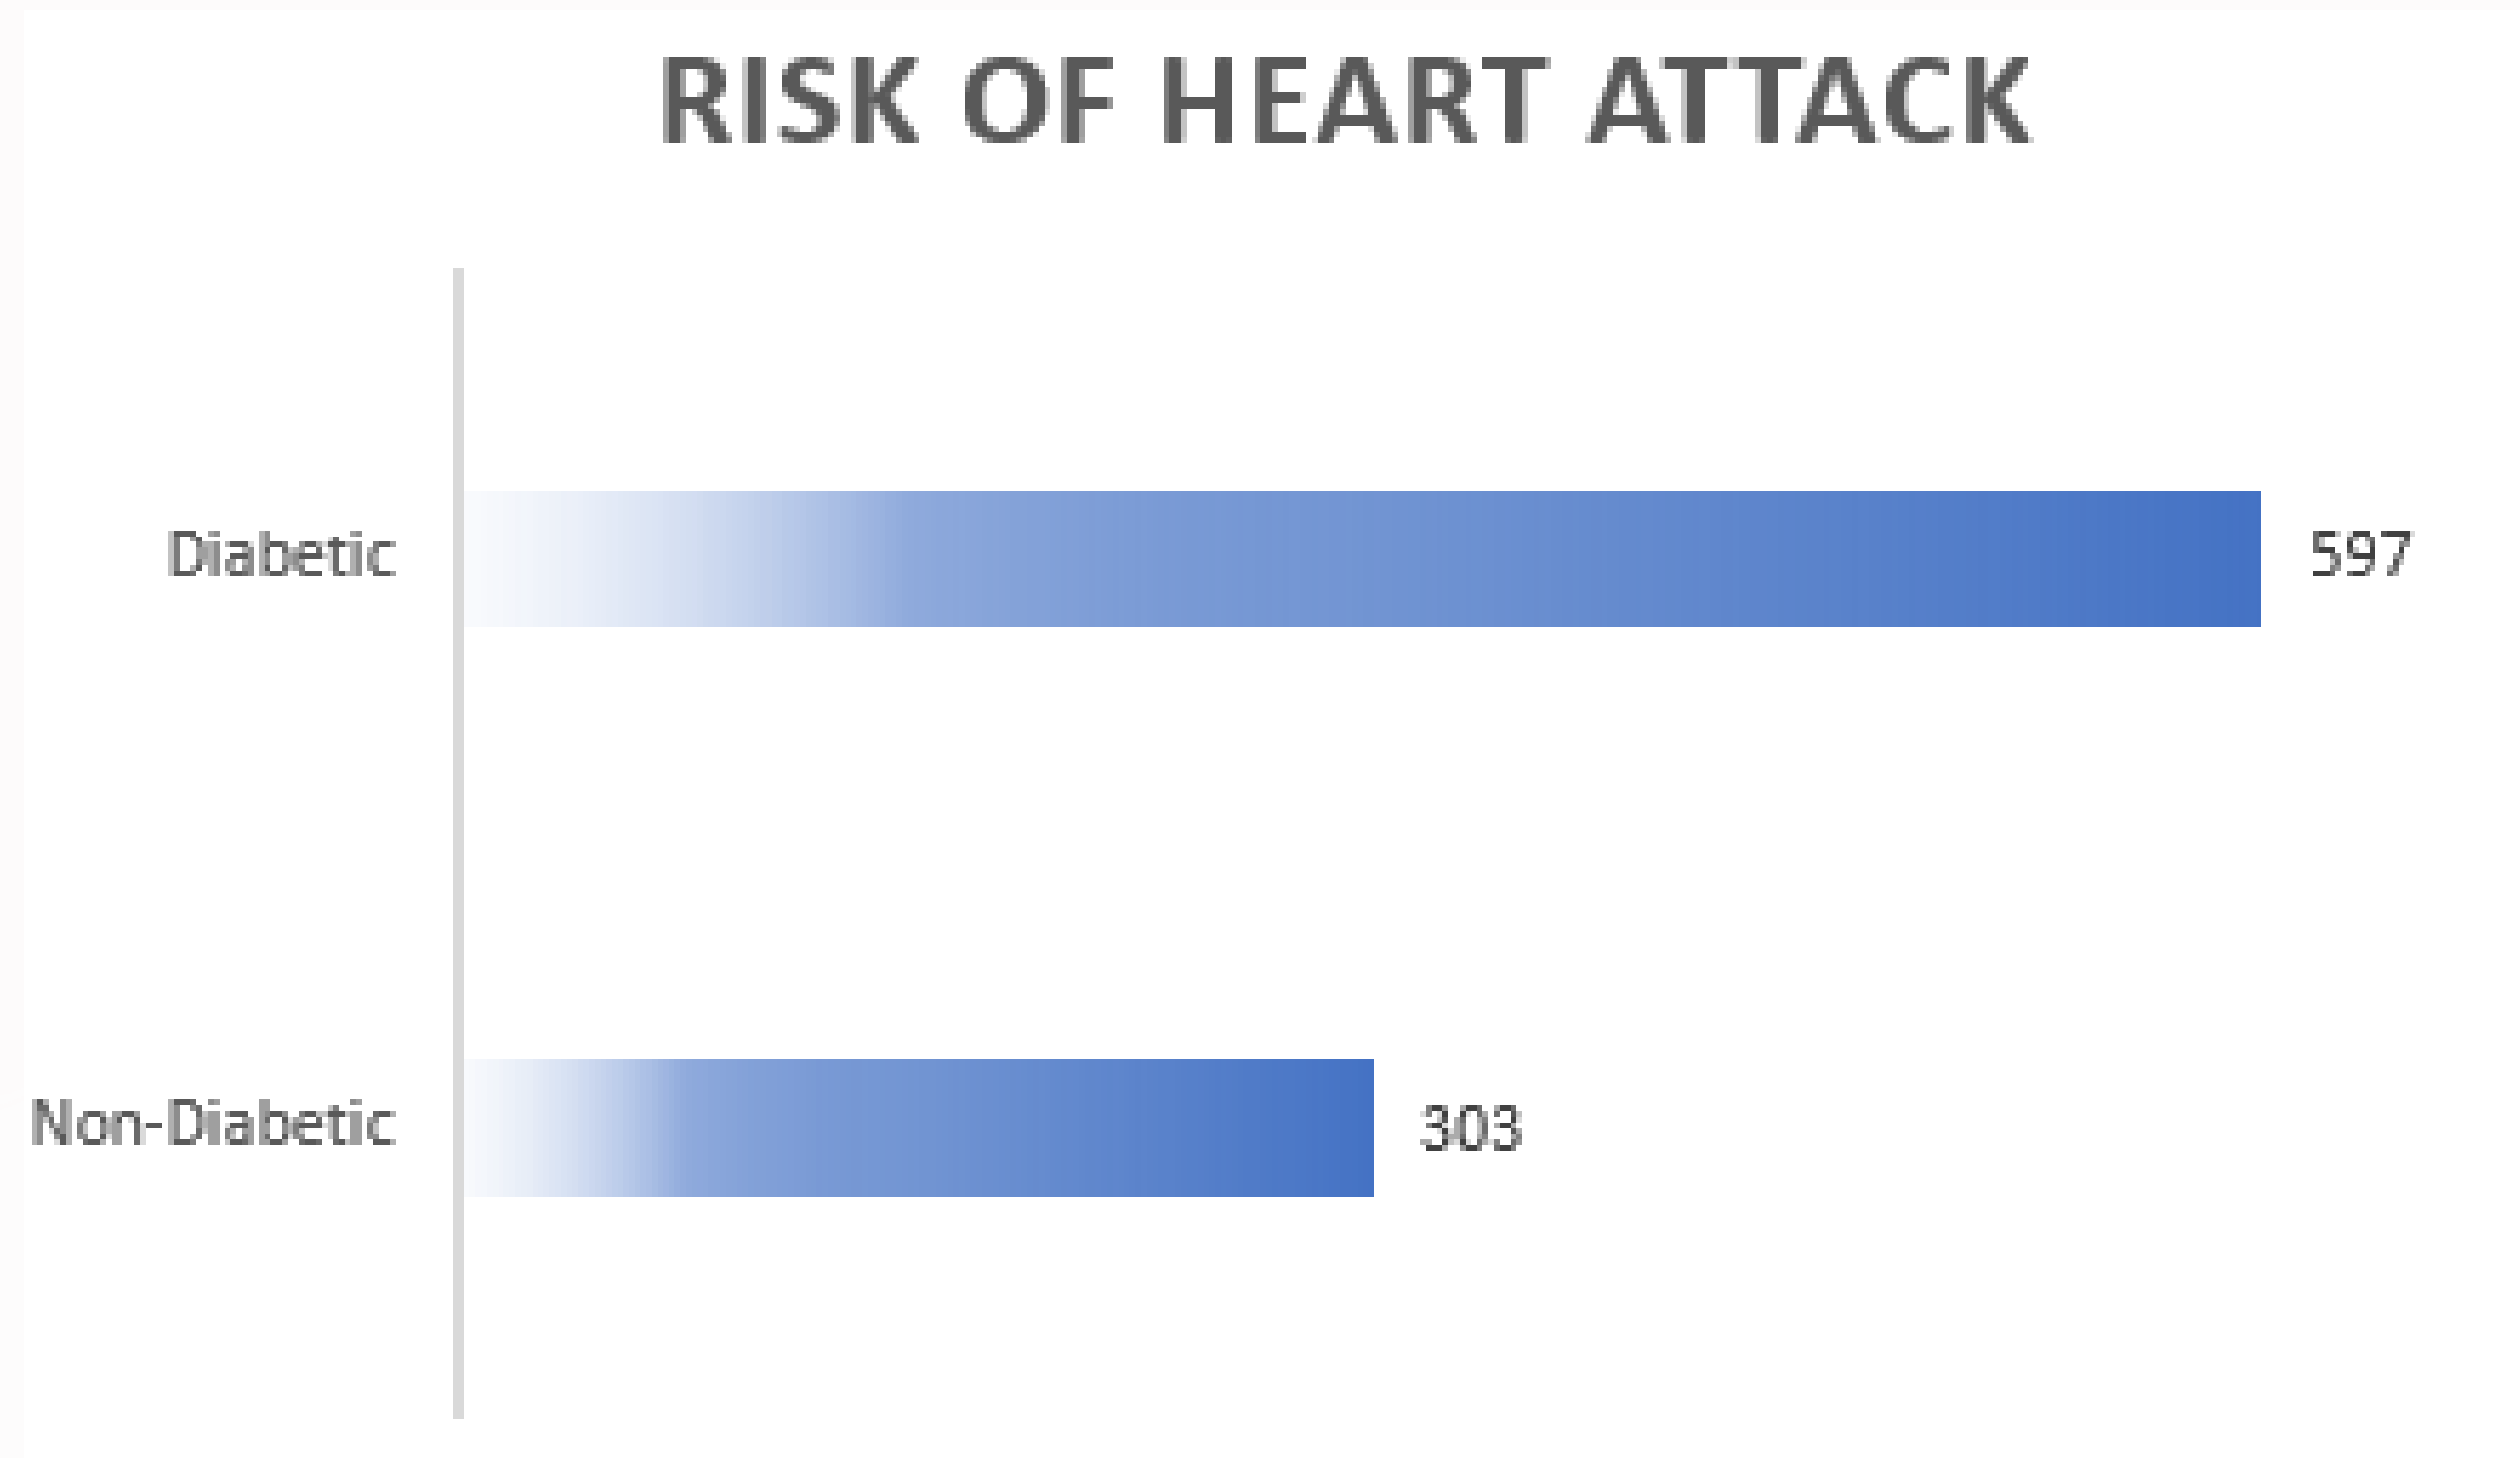

ALCOHOL CONSUMPTION

# RISK OF HEART ATTACK - SMOKERS VS. NON-SMOKERS

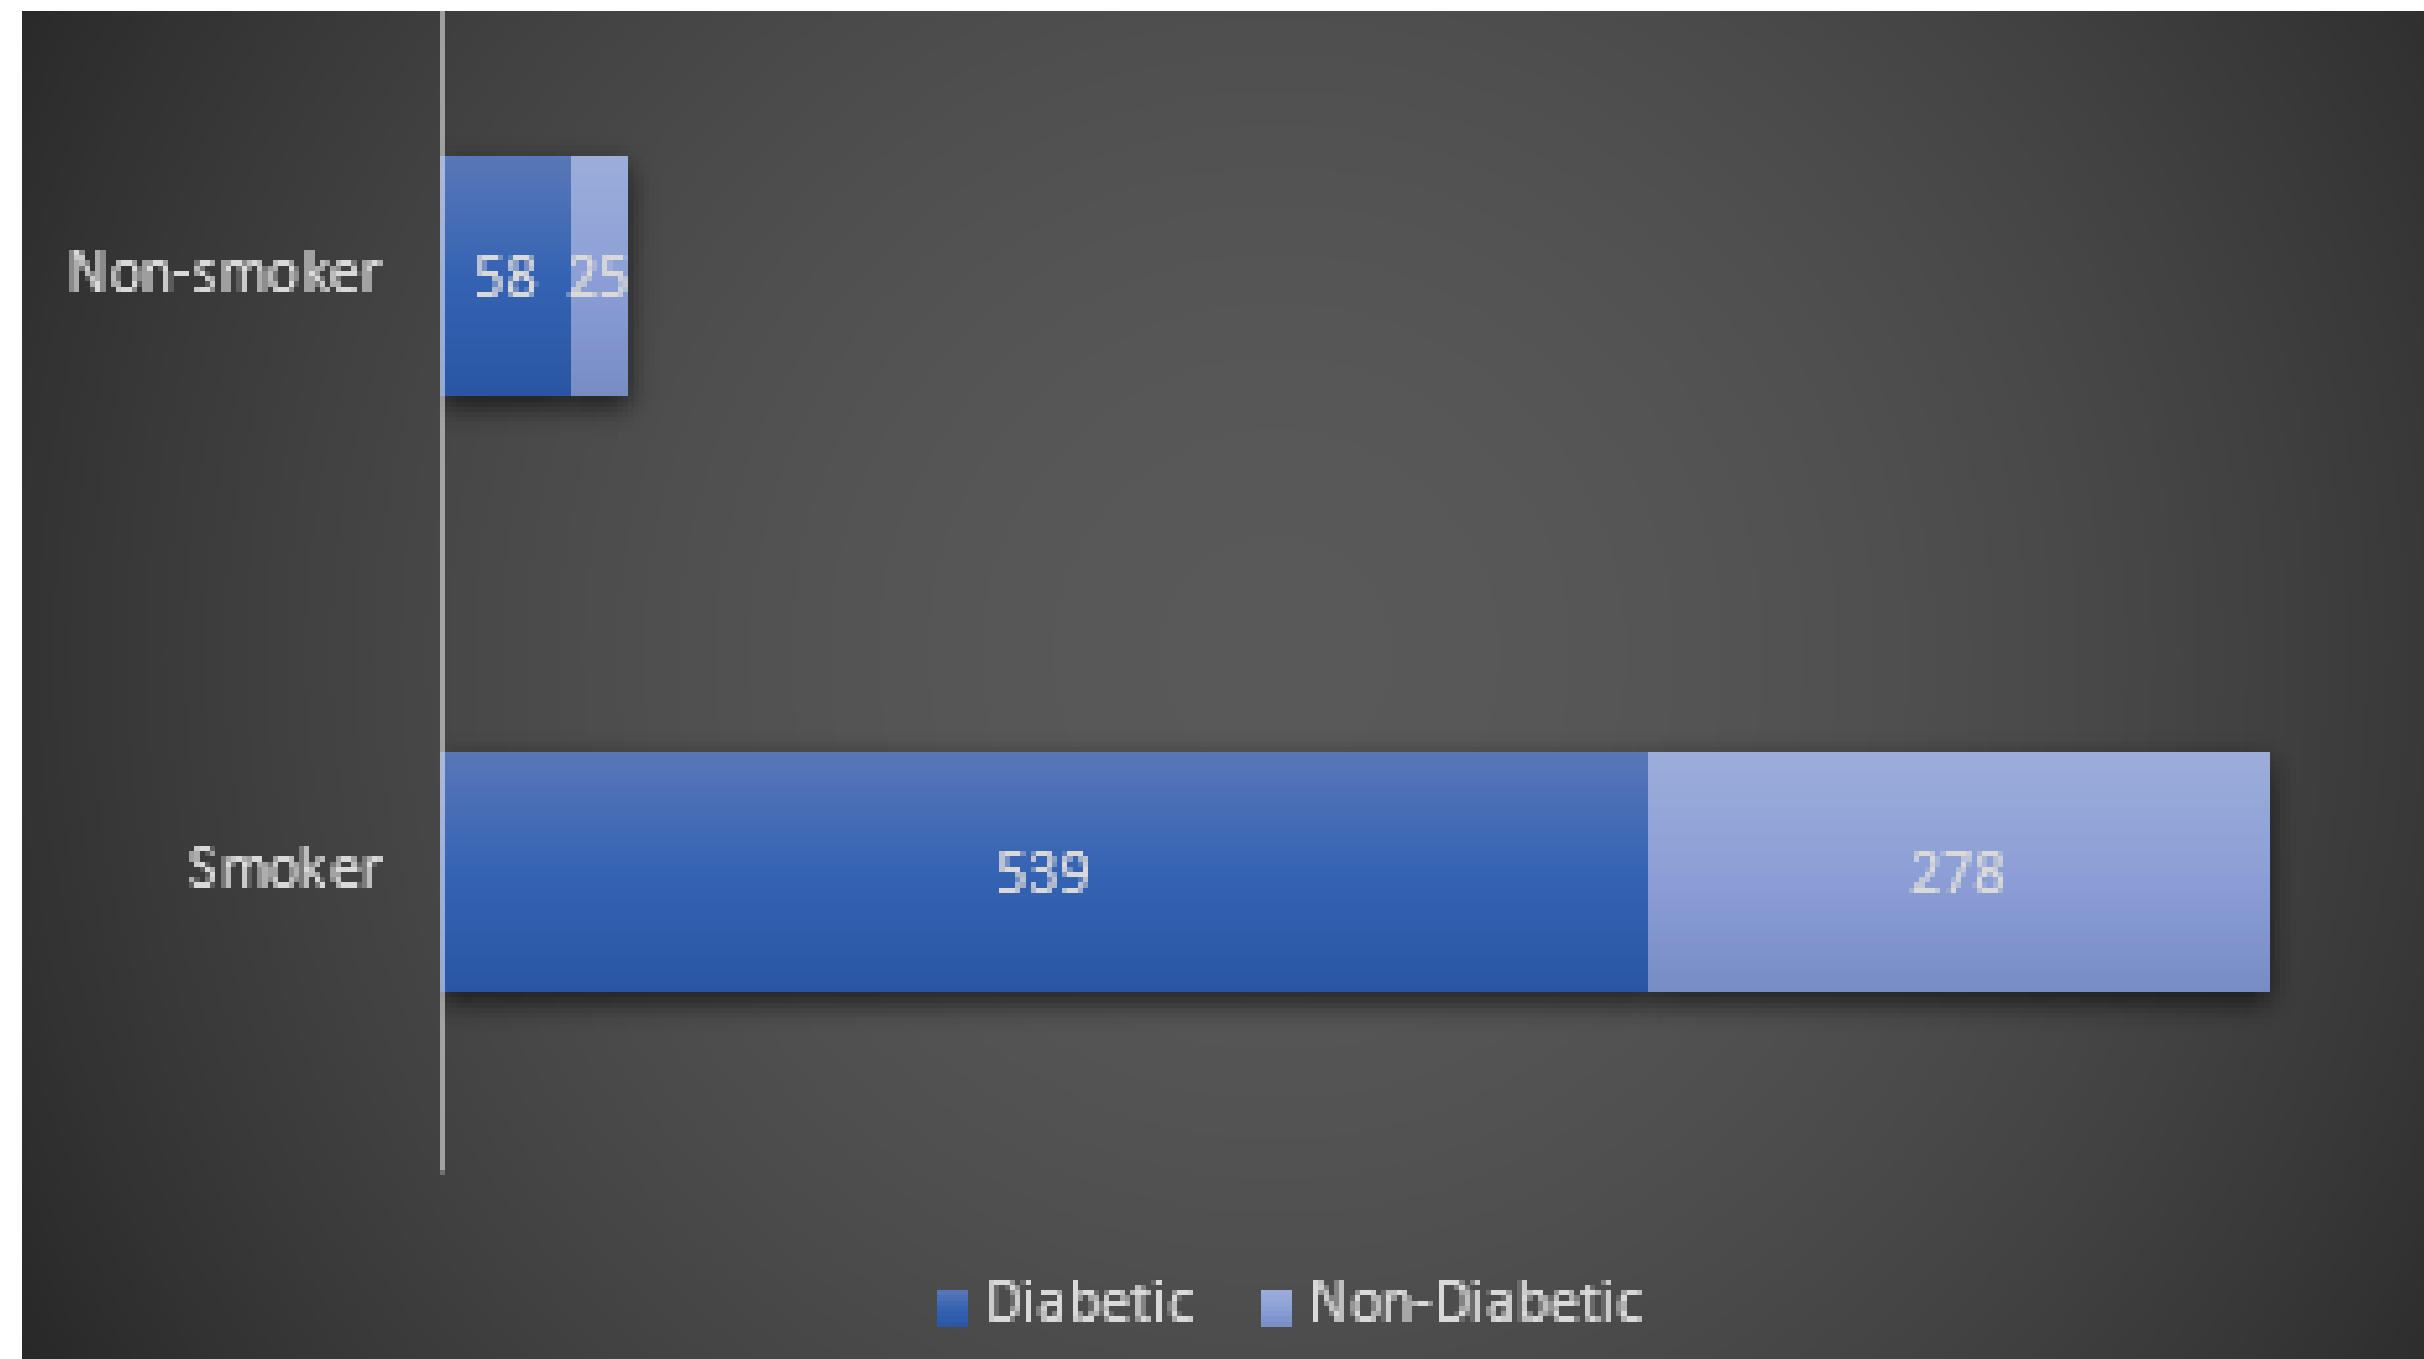

The one who smokes are more likely to have a heart attack

## RISK OF HEART ATTACK - DIABETIC PERSON VS. NON-DIABETIC PERSON

# ANALYSING RECORDS OF SMOKERS, NON-SMOKERS WITH DIABETIC AND NON-DIABETIC PATIENTS

The one who smokes and has Diabetes are more prone to Heart Attack

## CORRELATION OF ALCOHOL CONSUMPTION, SMOKING AND DIABETES

- The one who consumes alcohol, smokes and has diabetes are in high risk of heart attack and the count is 317.
- The one who consumes alcohol, smokes but non-diabetic are also in risk and the count is 170.
- The one who consumes alcohol, diabetic but doesn't smoke are also in risk but the count is less i.e., 32.
- The one who consumes alcohol, non-diabetic and doesn't smoke are also in risk but the count is less i.e., 12.
- Hence, besides consuming alcohol, one who smokes and has diabetes are found to be at high risk of heart attack and the count is maximum in this case.

## **CORRELATION OF PREVIOUS HEART PROBLEMS, ALCOHOL CONSUMPTION, SMOKING AND DIABETES**

- The one who has a record of previous heart problems, consumes alcohol, smokes and has diabetes are at high risk of heart attack.
- The one who has a record of previous heart problems, consumes alcohol, smokes but non-diabetic are also in risk.
- Similarly, The one who doesn't have a record of previous heart problems, consumes alcohol, smokes and has diabetes are at high risk of heart attack.
- Hence, we can conclude that the one who has been affected with 3 major risk factors are at high risk of heart attack and whether he suffers from previous heart problems or not doesn't matter at all.

# HOW HEALTHY HABIT FAILS TO WORK

It is found that

- One whose diet is healthy but consumes alcohol, smokes and is diabetic are in high risk of heart attack although the diet is healthy.
- One whose diet is healthy and is prone to anyone of the major risk factors (i.e., Smoking, Diabetes and Alcohol Consumption) are also at risk of heart attack.
- Similarly one whose diet is unhealthy and is prone to anyone of the major risk factors (i.e., Smoking, Diabetes and Alcohol Consumption) are also at risk of heart attack.
- Hence, Healthy Habits fails to work if one is prone to anyone of the Major Risk Factors

# RESEARCHER

**Priyanka**

Data Analyst

- Downloaded the dataset from Kaggle
- Research work is solely done by me.
- Technology used: SQL, Excel
- Presentation: Canva

**THANK  
YOU**
